                                                                                                                                                                               Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DB seq length:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            receptor, which may be used for the identification of TNF receptor agonists or antagonists. TNF receptor agonists inhibit tumour growth, stimulate cell (e.g. T cell) differentiation, mediate the immune and antiviral responses, regulate growth, protect against radiation and Chlamydia infection, and can be used to treat immunodeficiencies, e.g. human immunodeficiency virus. Antagonists can be used to treat T cell mediated autoimmune disease, inflammation, septic shock, cerebral malaria, cachexia or B cell cancers, to inhibit graft-host reactions and to prevent apoptosis or cytotoxicity. Fragments of the TNF receptor encoding DNA can be contained to the contained to the contained managements of the TNF receptor encoding DNA can be contained to the contained to the contained managements of the TNF receptor encoding DNA can be contained to the contained managements of the TNF receptor encoding DNA can be contained to the contained to the contained the contained to t

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                e.g. AP-1 induction, whilst agonistic antibodies may enhance HVEM regulation of such induction. The DNA may be used diagnostically, e.g. to determine if DNA and/or RNA encoding HVEM is present in cells, and to prepare HVEM polypeptide recombinantly. It is also useful to produce non-human transgenic animals (e.g. mice or rats), especially knockout animals containing cells with an altered gene encoding HVEM polypeptide. Such animals are useful in the development and screening of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   the invention. The protein is useful in quantitative diagnostic assays for HVEM, in affinity purification of HVEM from recombinant cells/natural sources and in competitive-type receptor binding assays. It can also be used to generate antibodies, also useful in diagnostic assays for HVEM and affinity purification of HVEM. HVEM is believed to be a member of the tumour necrosis factor receptor (TNFR) family, and transient transfection of HVEM into human 293 cells caused marked activation of certain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 transcription factors, e.g. AP-1, suggesting that HVEM is involved in regulating gene expression in response to infectious stimuli and cellular stress. The predominant expression of HVEM mRNA in lymphocyte-rich tissues (e.g. spleen and peripheral blood) also suggested it may be a receptor in regulating lymphocyte activity. Antibodies produced may therefore be useful therapeutically, e.g. antagonistic antibodies may be useful to block excessive inflammatory/autoimmune response resulting from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 1; Fig 1; 46pp; English.

                                                                                                                                                     This sequence represents human PRO509 (UN0329), a protein encoded by the novel cDNA clone DNA50148 (see AAX87264), and a member of the tumour necrosis factor receptor family. Amplification of DNA50148 was observed in various tumour tissues, suggesting a role in tumour formation or growth. Antagonists (e.g. antibodies) directed to PRO509 may have use in cancer therapy. The invention identifies 14 genes (see AAX87254-67) that are amplified in the genome of tumour cells. Such amplification is expected to be associated with overexpression of the gene product and to contribute to tumorigenesis. The encoded proteins (see AAX66477-90) may be useful targets for the diagnosis and/or treatment (including prevention) of certain cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                            22-MAY-1998;

```

This invention relates to an isolated nucleic acid molecule encoding a human tumour necrosis factor(TNF)-receptor related protein TR2. Included in the invention are the two splice variants of TR2, TR2-SV1 and TR2-SV2 The TR2 gene is located on chromosome 1 at position p36.2-p36.3. TR2 is a

, TR2-SV1 and p36.2-p36.3.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              C Ireatment of aftericis or infinimulation using an antibody universe against CC a fragment of the TR2 protein. TR2 its agonists, antiagonists and CC immunosuppressive, antiallergic, antiarthritic, antianaemic, CC antibodies exhibit cytostatic, dermatological, antianaemic, CC antibodies exhibit cytostatic, dermatological, antianaemic, and CC cerebroprotective activity. The methods are useful for treating arthritis CC or inflammation, cancer (such as follicular lymphomas, carcinoma with p53 CC mutations, cardiac tumours, pancreatic, breast, or prostate cancer), an CC immunodeficiency or for enhancing an in vivo leukocyte response to an CC immunodeficiency or encephalomyelitis, rheumatoid arthritis, asthma, and CC inflammatory myopathies) and immunodeficiency disorders (such as actoimmune haemolytic anaemia, CC inflammatory myopathies) and immunodeficiency disorders (such as severely CC combined immunodeficiency (SCID) x linked, B cell lymphoproliferative CC inflammatory myopathies) and immunodeficiency with Igs). TR2, CC TR2-SV1 and/or TR2-SV2 polynucleotides and polypeptides, agonists or CC antagonists are useful for treating or preventing autolimmune diseases and CC inhibit the growth, progression and/or metastasis of cancers. They are CC also used to activate, differentiate or proliferate cancerous cells or CC insues, and can be used to treat diseases associated with increased cell survival, or the inhibition of apoptosis, e.g. Alzheimer's disease, CC Parkinson's disease, or Crohn's diseases. The TR2 polypeptides are useful CC as sources for generating antibodies, as molecular weight markers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Qy

                             The present sequence represents a novel human polypeptide. The specification describes novel polypeptides designated PRO201, PRO292, PRO377, PRO1265, PRO344, PRO343, PRO347, PRO357, PRO715, PRO1017, PRO1112, PRO509, PRO853 and PRO882. These genes are amplified in the genome of tumour cells. The polypeptides are believed to contribute to tumourigenesis. The polypeptides are useful target for the prognosis of tumour cancers, and may act as predictors of the prognosis of tumour treatment. Antibodies against these polypeptides are useful in the treatment and diagnosis of neoplastic cell growth

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is that of human antitumour protein PRO509, as deduced from a retinal cDNA clone (see AAA49727). PRO509 shows homology to members of the human tumour necrosis factor receptor family such as the lymphotoxin-beta receptor (11 identities) and CD40 (12 identities). A claimed method for inhibiting the growth of a tumour cell comprises exposing the tumor cell to PRO179, PRO207, PRO320, PRO219, PRO221, PRO221, PRO2256, PRO326, PRO326, PRO326, PRO326, PRO326, PRO327, PRO327, PRO327, PRO327, PRO327, PRO327, PRO328, PRO509 or PRO866 (see AAY95337-49), their agonists cohimeric polypeptides incorporating them. The tumour is especially a cancer selected from breast, ovarian, renal, colorectal, uterine,

                                                                                                                                                             The human tumour necrosis factor (TNF) receptor related protein (TR2) is a member of the TNF family and displays considerable homology to murine CD40. It can be used in soluble forms to treat herpes simplex virus infection and TR2 proteins (or their agonists or antagonists) are used to treat disease associated with aberrant cell survival. Agonists may also be used to protect against the effects of radiation therapy and to stimulate lymphocyte proliferation and differentiation in patients infected by human immune deficiency syndrome.

                                      This sequence represents the human tumour necrosis factor (TNF) receptor-like 2 (TR2) protein. Antibodies that target the TR2 protein can be used in the method of the invention to treat pathological conditions. The method is used to treat systemic lupus erythematosus, idiopathic thrombocytopaenic purpura, rheumatoid arthritis, multiple sclerosis, psoriasis, inflammatory bowel disease, insulin-dependent diabetes mellitus, allergic disorders, e.g. asthma, allergic rhinitis and atopic dermatitis, cancer, e.g. lymphomas and leukaemias, artherosclerosis and viral infections, e.g. Herpes simplex virus and AIDS. The TR2 antibody is also used to monitor and diagnose abnormalities in TR-2 function,

cc earthinflammatory, nuturities, including the control of antiinflammatory, naturation, and ccrebroprotective activity. The methods are useful for treating arthritis cor inflammation, cancer (such as follicular lymphomas, carcinoma with p53 cc mutations, cardiac tumours, pancreatic, breast, or prostate cancer), an climmunodeficiency or for enhancing an in vivo leukocyte response to an antigen. Anti-TR2 antibodies are useful for treating, inhibiting or comprehenting autoimmune diseases (such as autoimmune haemolytic anaemia, dc dermatitis, allergic encephalomyelitis, rheumatoid arthritis, asthma, and combined immunodeficiency (SCID)-X linked, B cell lymphoproliferative combined immunodeficiency (SCID)-X linked, B cell lymphoproliferative combined immunodeficiency combined immunodeficiency with Igs). TR2, TR2-SV1 and/or TR2-SV2 polynucleotides and polypeptides, agonists or antagonists are useful for treating or preventing autoimmune diseases and linhibit the growth, progression and/or metastasis of cancers. They are calso used to activate, differentiate or proliferate cancerous cells or tissues, and can be used to treat diseases associated with increased cell survival, or the inhibition of apoptosis, e.g. Alzheimer's disease, cell as sources for generating antibodies, as molecular weight markers.

CC This sequence represents the TR2 receptor protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     a fragment of the TR2 protein. TR2 its agonists, antagonists and antibodies exhibit cytostatic, dermatological, antianaemic, immunosuppressive, antiallergic, antiarthritic, antiasthmatic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The TR2 gene is located on chromosome 1 at position p36.2-p36.3. TR2 is a member of the TNFR superfamily. The invention includes a method for the treatment of arthritis or inflammation using an antibody directed against

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to an isolated nucleic acid molecule encoding a human tumour necrosis factor(TNF)-receptor related protein TR2. Included in the invention are the two splice variants of TR2, TR2-SV1 and TR2-SV2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 1;

                                                                                                                                                                                                                                                          δÃ
                                                                                                                                                                                                                                                                                                                                                                  밁
                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to identifying agonists or antagonists to tumour necrosis factor receptor (TNN-R) related polypeptides (TR1 and TR2, TL2 and TL4). The method comprises: (a) (i) contacting TR1 or TR2 with a candidate compound in the presence of TL2 or TL4; or (ii) contacting TR1 or TR2; and (b) assessing the ability of the candidate compound to compete with TR1 or TR2 binding to TL2 or TL4. TR and TL agonists and antagonists are useful for treating diseases caused by imbalance of TL or TR polypeptide levels, which cause: chronic and acute inflammation, arthritis, septicemia, autoimmune diseases, transplant rejection, graft vs. host disease, infection, stroke, ischemia, acute respiratory disease syndrome, restenosis, brain injury, AIDS, bone diseases, cancer, athersclerosis and Alzheimer's disease. The present sequence represents a TNF-R related polypeptide TR2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       29-AUG-1997;

```
Human herpes simplex virus (HSV) cellular mediator (HVEM) (AAW12659) is a novel member of the TNF/MGF receptor family that mediates or enhances entry of HSV into cells. Its amino acid sequence was deduced from a cDNA clone (AAT51737) isolated from an HeLa library by its ability to convert CHO-KI cells from resistance to susceptibility to HSV-1 entry. Recombinant HVEM can be produced in bacterial or mammalian (esp. CHO) cells. It can be used as an immunoassay reagent to detect specific antibodies, to screen for
                                                                                                                                                                                                  New human herpes simplex virus cellular mediator - used for diagnosis, drug screening and therapeutically to inhibit entry HSV into cells
                      drugs having an (ant)agonist effect on HSV entry into cells, generate antibodies, to screen for the (currently unknown) H ligand, and to identify inhibitors of HSV-HVEM interaction.
                                                                                                                                                                         Claim 1; Fig 2; 54pp;

virus (HSV) entry mediator that is a member of the tumour necrosis factor receptor family, and which confers on HSV the ability to infect and replicate in otherwise non-permissive cells. In the present invention, the combination of a novel porcine cell model system which is refractory to HCV entry, along with specific HSV B5 (see AAY05796) and/or HVEM receptor proteins enables the development of assays for screening antiviral compounds and therapeutics. The assays are useful for detecting the ability of agents to inhibit HSV entry or spread and provide for facile high-throughput screening of compounds suspected to be able to inhibit such entry, e.g. compound libraries, peptide libraries etc., to identify
                                                                                                                                                                                                                                   The present sequence represents HVEM, a novel human herpes simplex

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   disrupted. DNA encoding HVEM, HVEM proteins and HVEM antibodies can be used in screening and detection assays (e.g., chromosomal mapping, tissue typing). HVEM proteins can also be used for regulation of cell proliferation, cell differentiation, cell survival, inflammation mast cell activity, HSV infection and/or proliferation, and/or coagulation. HVEM agonists can be used to treat disorders associated with decreased HVEM activity, e.g. proliferative disorders such as carcinoma or pathogenic infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (see AAZ94198). mHVEM2 is a TANGO-69-receptor and member of the tumour necrosis factor receptor (TMFR) superfamily. HVEM plays a role in herpes simplex virus (HSV) entry. The invention is based on the discovery of 3 cDNA molecules (see AAX94195-97) which encode soluble forms (see AAY79204-06) of mHVEM, and the cDNA molecule encoding of mHVEM2. In addition to isolated full-length proteins and polynucleotides, and invention provides TANGO-69-receptor fusion proteins, antigenic peptides and antibodies. Also provided are recombinant expression vectors, host cells and transgenic animals in which a TANGO-69-receptor gene has been introduced or the provided of the provided are recombinant expression vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               is human membrane-bound herpesvirus entry mediator-2 (mHVEM2), a novel form of membrane-bound herpesvirus entry mediator (mHVEM), novel form of membrane-bound herpesvirus entry mediator (mHVEM). The amino acid sequence was deduced from an isolated cDNA clone (see AAZ94198), mHVEM2 is a TANGO-69-receptor and member of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New nucleic acid molecule encoding herpes virus entry mediator (HVEM), either in the soluble or membrane bound form, is useful in screening assays and detection assays \cdot
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     03-SEP-1998;

C (see AAZ94195). SHVMNI is a TANGO-69-receptor and members of the tumour necrosis factor receptor (TNFR) superfamily. It is thought to play a role analagous to other soluble members of the thought to play a role analagous to other soluble members of the TNFR superfamily by interfering with the ability of LIGHT-TANGO-69 and lymphotoxin to bind mHVEM, and to play a role in herpes simplex virus (HSV) entry. The invention is based on the discovery of 3 CCDNA molecules (see AAZ94195-97) which encode soluble forms (see CCDA, molecules (see AAZ94195-97), of mHVEM. In addition to isolated full-length proteins and polynucleotides, and invention CC isolated full-length proteins and polynucleotides, and invention CC provides TANGO-9-receptor fusion proteins, antigenic peptides and CCC antibodies. Also provided are recombinant expression vectors,

DNA encoding HVEM, HVEM proteins and HVEM antibodies can be used in screening and detection assays (e.g. chromosomal mapping, tissue typing). HVEM proteins can also be used for regulation of cell proliferation, cell differentiation, cell survival, inflammation mast cell activity, HSV infection and/or proliferation, and/or coagulation. HVEM agonists can be used to treat disorders associated with decreased HVEM activity, e.g. proliferative disorders such as carcinoma or pathogenic infection. Antagonists can be used to treat disorders associated with increased HVEM activity, e.g. autoimmune, T cell, inflammatory and allergic inflammation disorders.

The anticours of the Common transfer of the CC thought to play a role analagous to other soluble members of the CC TMFR superfamily by interfering with the ability of LIGHT-TANGO-69 CC TMFR superfamily by interfering with the ability of LIGHT-TANGO-69 CC and lymphotoxin to bind miyEM, and to play a role in herpes simplex virus (HSV) entry. The invention is based on the discovery of 3 CC cDNA molecules (see AAZ94195-97) which encode soluble forms (see AAY9204-66), and I cDNA molecule (see AAZ94198) that encodes a 2nd membrane-bound form (see AAY79207), of mHVEM. In addition to consisted full-length proteins and polynucleotides, and invention CC provides TANGO-69-receptor fusion proteins, antipenic epetides and committees and transgenic animals in which a TANGO-69-receptor gene has been introduced or disrupted. DNA encoding HVEM, HVEM commonsomal mapping, tissue typing). HVEM proteins and HVEM antibodies can be used in screening and detection assays (e.g. chromosomal mapping, tissue typing). HVEM proteins can also be used for regulation of cell proliferation, cell activity, cell survival, inflammation mast cell activity, cell sound for proliferation, and/or coagulation. HVEM activity, e.g. proliferative disorders such as carcinoma or cassociated with increased HVEM activity, e.g. autoimmune, T cell, inflammatory and allergic inflammation disorders.
  is human soluble herpesvirus entry mediator-2 (sHYEM2), a novel soluble form of membrane-bound herpesvirus entry mediator (mHYEM The amino acid sequence was deduced from an isolated cDNA clone (see AAZ34196). sHYEM2 is a TANGO-69-receptor and member of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid molecule encoding herpes virus entry mediator (HVEM), either in the soluble or membrane bound form, is useful in screening assays and detection assays - {\sf var}
